

CLICK FOUNDRY RELEASE NOTES

R1.0.0 FOUNDRY LAUNCH

Gameplay-facing changes for the public build. Share the PDF version as [click-foundry-r1.0.0-patch-notes.pdf](#).

PATCH NOTES

- The complete mobile-first factory journey now runs from hand gathering and bronze work through Steam, low voltage, aluminium, multiblocks, and the Shattered Reach.
- The Factory Floor expands to 18x16, remembers the player's zoom between views, keeps the current zoom when machines open, and includes dedicated production and maintenance views.
- Every machine now opens a phone-fitted terminal with live inputs, outputs, storage, progress, power, Steam, fluids, routing, automation, and blocked-state feedback.
- Factory tool modes have been removed; machine removal, routing, maintenance, and automation controls now live directly in each machine terminal.
- Hoppers can pull finished items from machines and Auto Miners, buffer them, and feed chests or valid machine inputs for complete machine-to-storage and machine-to-machine lines.
- The recipe browser now covers hand crafting, machine processing, machine blocks, and fluids, links inputs and outputs in both directions, and identifies the earliest valid processing machine.
- Machine recipe pickers support recipe cycling and automatic item loading, show real item, machine, and fluid outputs, and clearly report missing or blocked inputs.
- The Steam era now includes wells, boilers, tanks, fluid pipes, specialised processing machines, Coke Oven liquid routing, and Bricked Blast Furnace steel production.
- Low-voltage power now uses amp-rated Tin Cables, battery buffers, sodium and lithium batteries, connected EU storage, and a multi-feed Arc Blast Furnace power milestone.
- Steam and LV Auto Miners keep local outputs, work with hopper extraction, support common built-in targets, and use reusable Survey Cards for rarer deposits.
- The Shattered Reach adds a formed Reach Gate, remote sulfur gathering, chemical processing, portable fluid cells, and a complete Liquid Rubber production chain.
- Liquid Rubber is now a distinct black fluid in the Terminal and recipe system, with separate reactions for producing the liquid and curing it into solid Rubber Bars.
- Quest chapters and layouts have been rebuilt to teach the intended progression order, keep optional branches optional, and guide players without preventing knowledgeable players from crafting ahead.
- Late LV materials now have purposeful routes: nickel ingots alloy into cupronickel, lead plates improve battery-cell assembly, and aluminium fittings assemble lightweight pistons.
- Save handling now includes three named slots, import and export, offline progress, migrations for older factories, update prompts, and a confirmation before New Game can replace a save.
- A complete phone-interface pass keeps machine terminals and core workflows inside mobile bounds, adds compact scrolling only where required, and improves navigation, feedback, icons, and fluid presentation.
